Mount a network drive on a Windows machine

In order to access data or code provided to you in the Windows lab, you will need to map a network drive to your local machine. Select the Computer icon from the start menu (Figure 1).

If the machine is not configured with the Computer link on the start menu, open Windows Explorer and navigate to computer. Regardless, you should see something like Figure 2.

Click on the “Map network drive” button that is highlighted in Figure 2. A dialog will appear (Figure 3). Select an unused drive letter and write `\cathouse\speech` for the network path (folder). Click Finish.

You should now have access the folder.

Note: The folder cannot be mapped outside of the campus network, so this cannot be done from home.
